

## Human Physiology: Testing and Communication Lab

Tom Clegg, November 2021

One of the most important things in administering a physiological test is how you administer the test and communicate with the client. Medical Biology practical students practiced conducting a range of physiological tests and were guided in how to prepare the client and communicate what the results actually mean. It sounds simple but takes some practice and confidence in your abilities and knowledge. The students spent lots of time just getting confident with the equipment and procedures so they can then concentrate in the finer points of client welfare and communication. You might know what the results mean but can you explain this to your client? The students really enjoyed this part of the learning process.
